Search: Find text across all loaded resources

Sofia Emelianova

Use the **Search** panel to find text across all loaded resources.

★ **Note:** The **Search** panel doesn't show results from network headers and responses. To search across them, follow the steps in [Search network headers and responses](#).

Alternatively, use [built-in search bars](#) to find text in a resource opened in a specific tool.

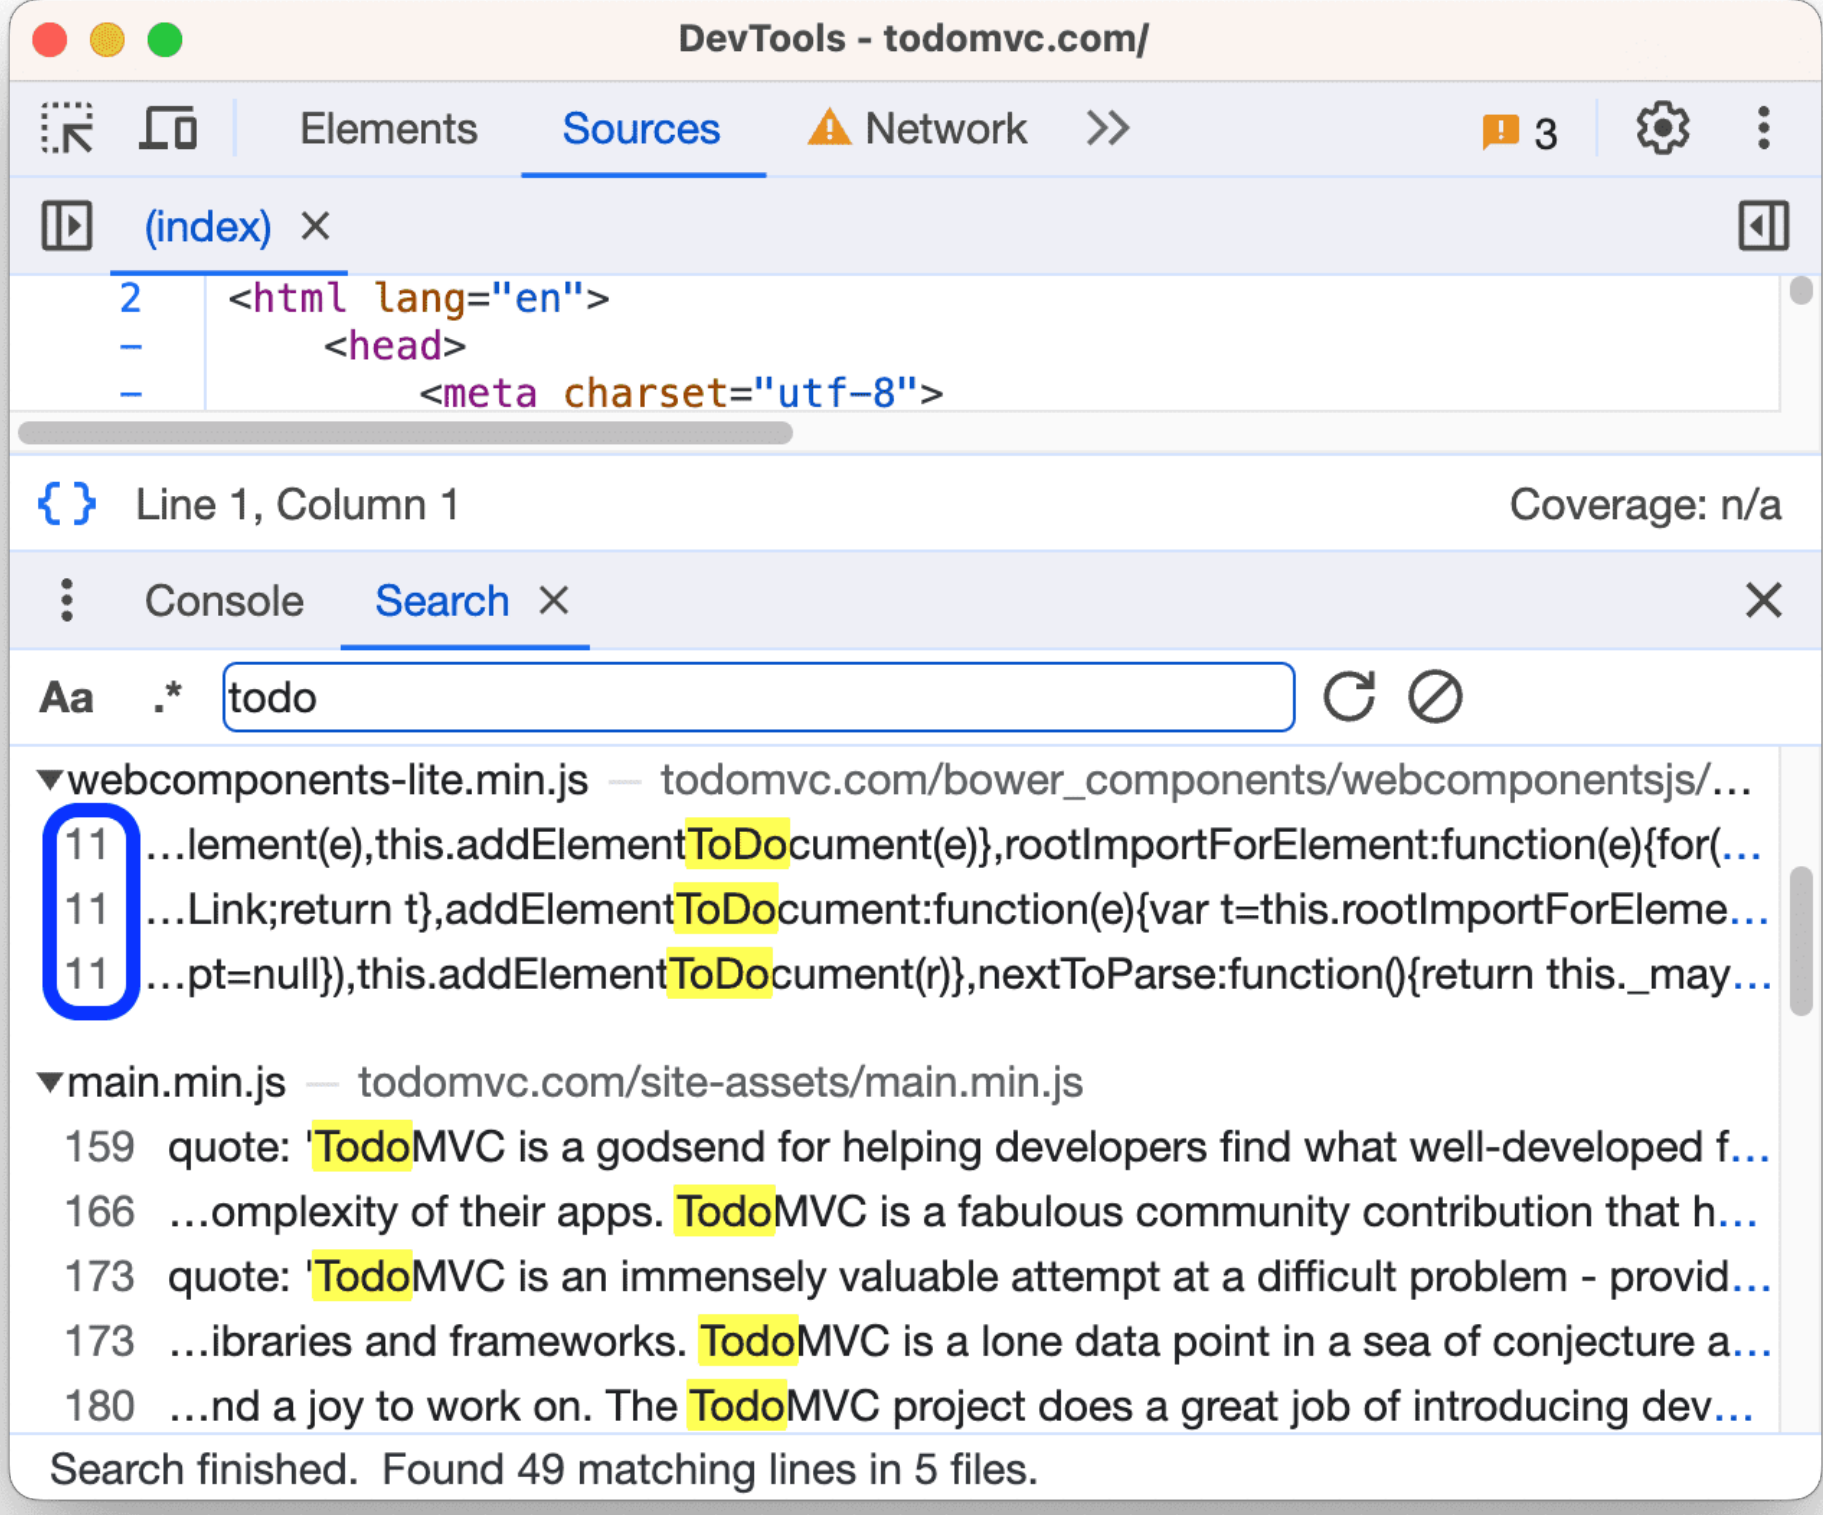

Open the Search panel

You can open the **Search** panel in several ways. First, [open DevTools](#), then do one of the following:

- In the top-right corner of DevTools, select **Customize and control DevTools > More tools > Search**.
- Press `Esc` to open **Drawer**, and in the top-left corner, select **More Tools > Search**.
- Press `Command+Option+F` (Mac) or `Control+Shift+F` (Windows/Linux).

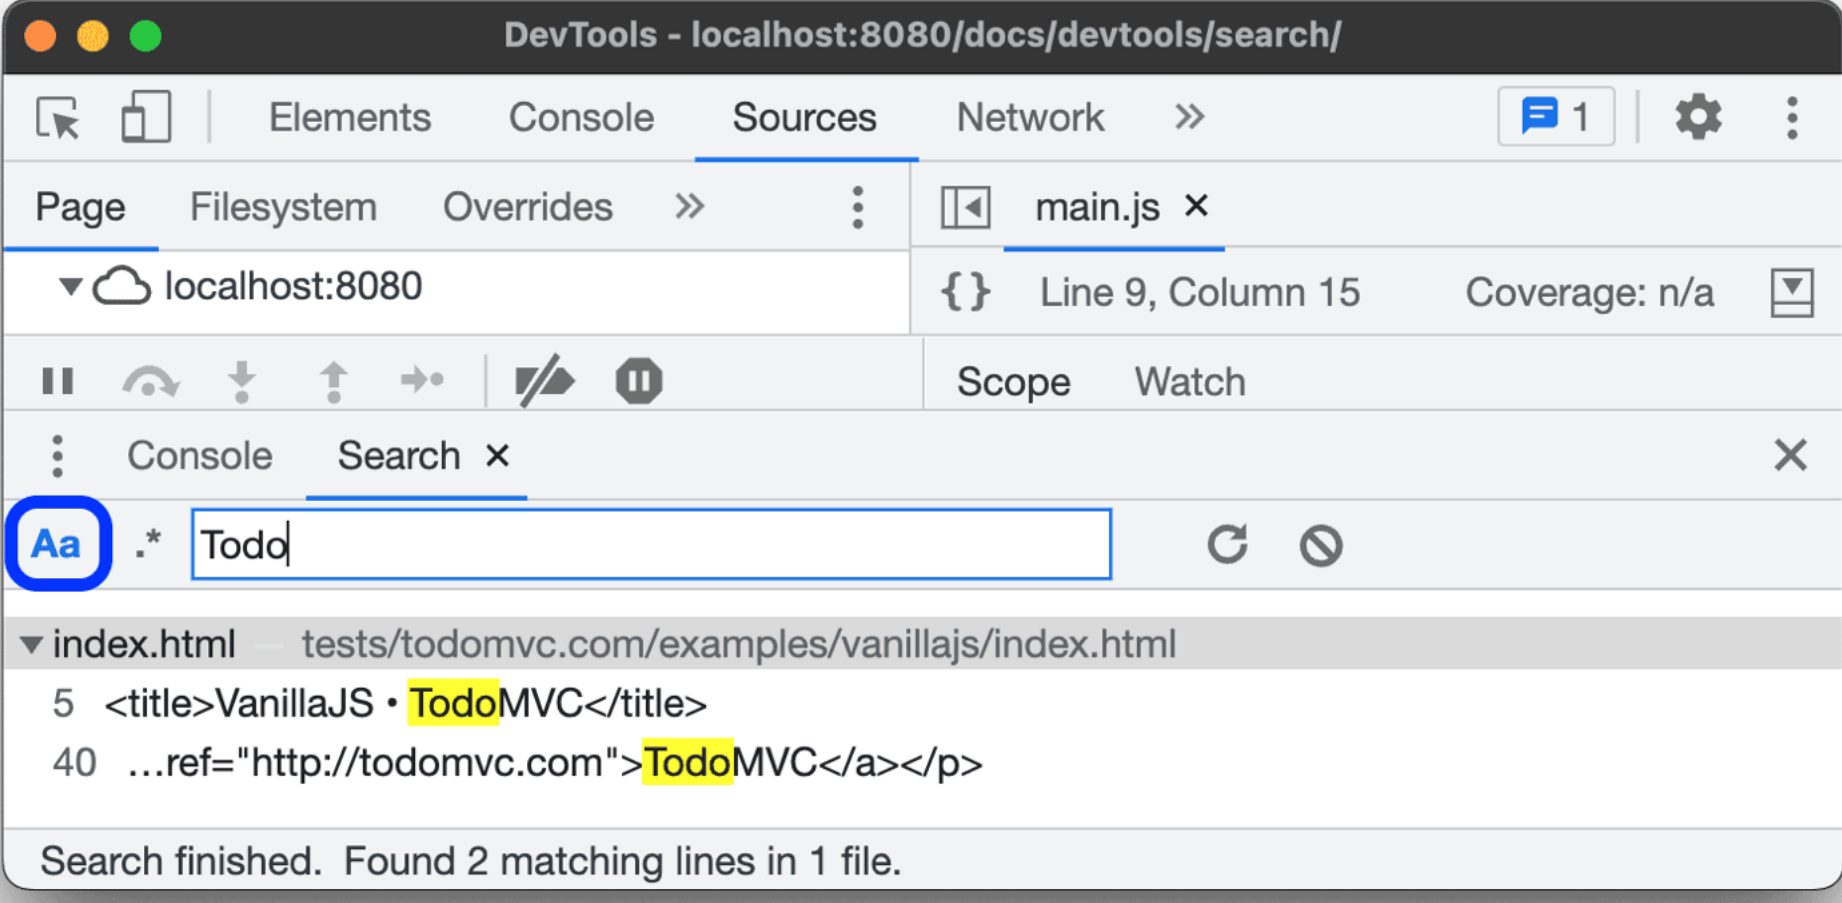

Search for text across all loaded resources

To search for text across all loaded resources, in the search bar on the **Search** panel, type your query and press `Enter`.

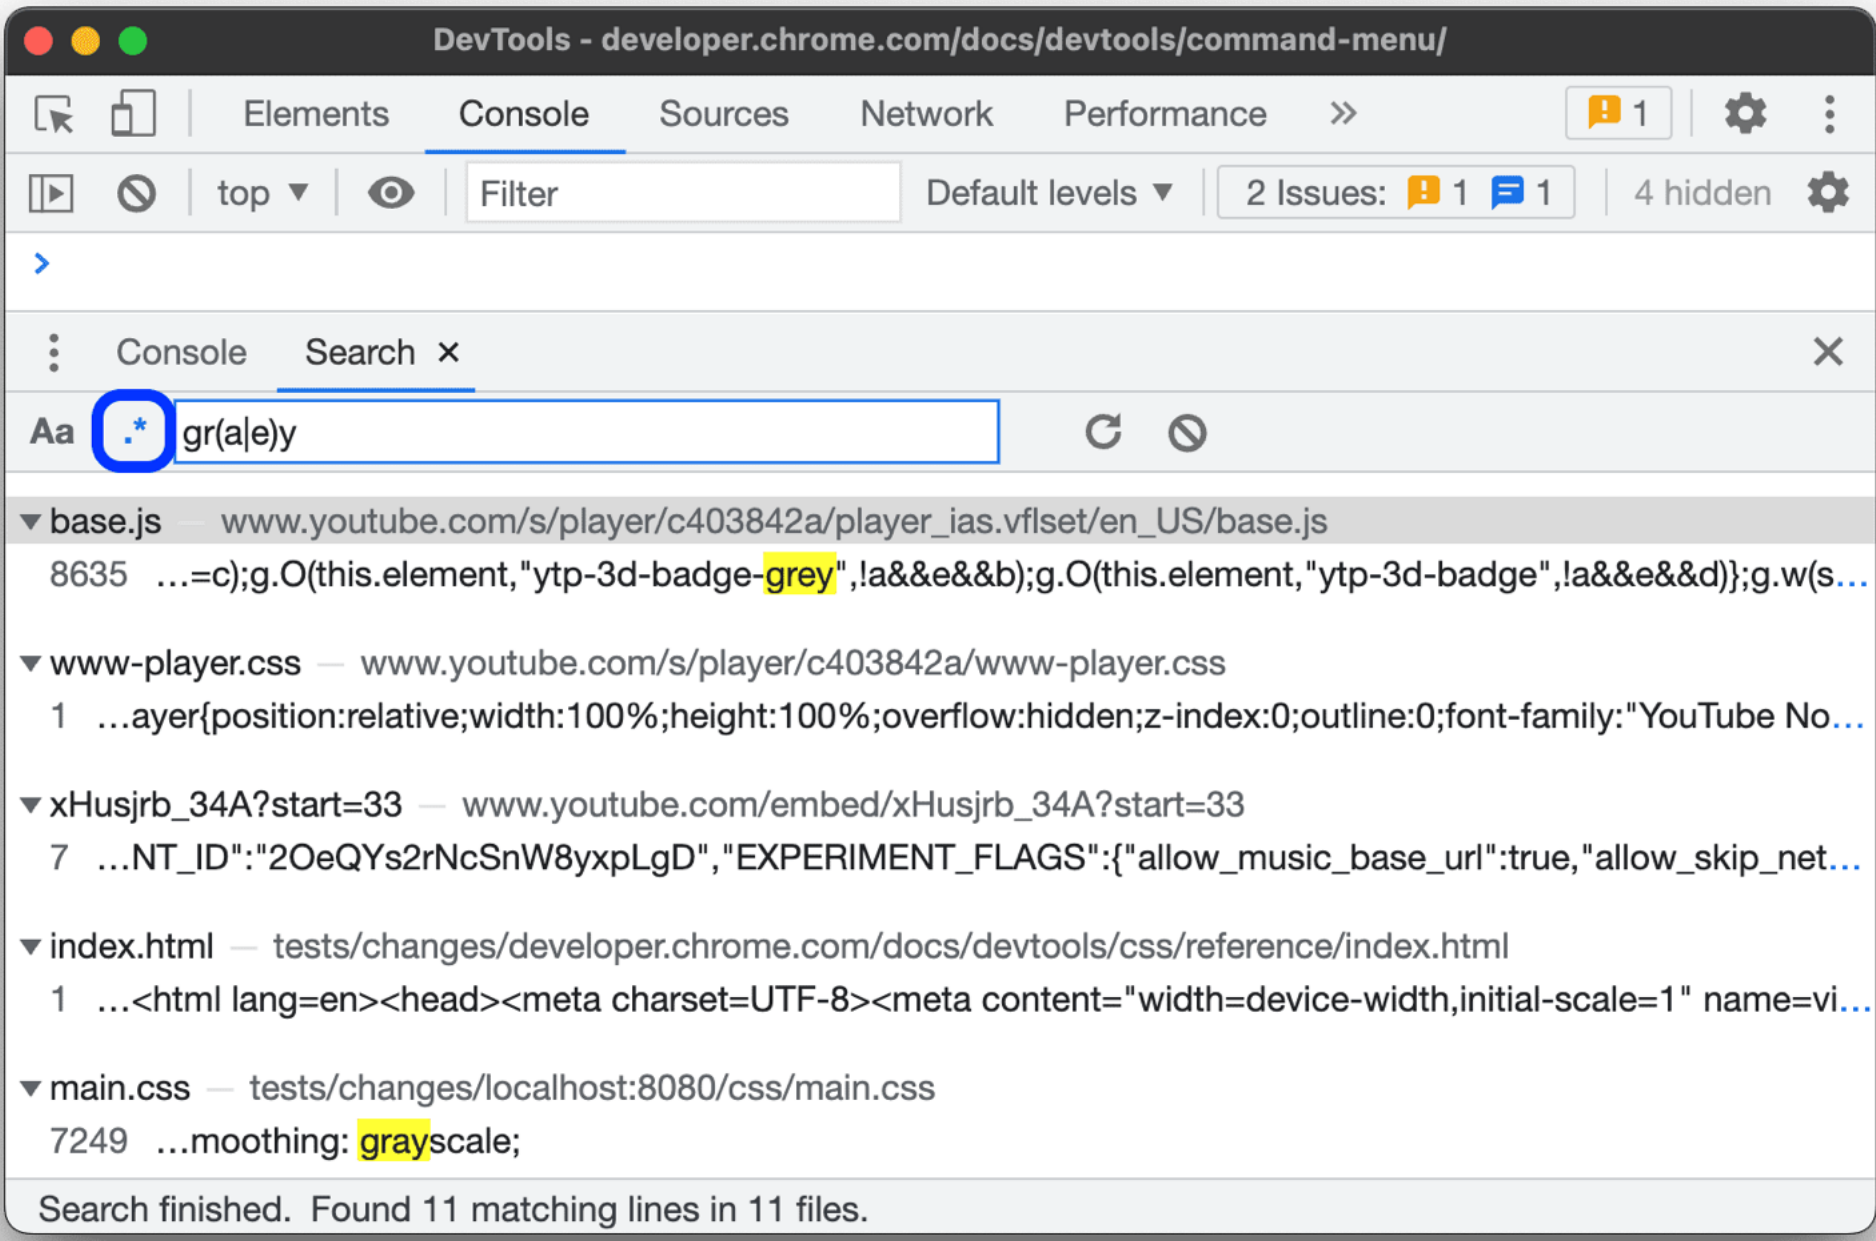

When DevTools finds several matches in a single line, the search results list all of them with the same line number. Click a search result and DevTools opens the line in **Sources** and scrolls the match into view.

To make your query case-sensitive, toggle the **Match case** button.

To search for text that matches a regular expression, toggle the **Regular expression** button.

★ **Tip:** You don't need to wrap your regular expression query in forward slashes.

Rerun a query, expand, and clear results

To rerun your search query, click **Refresh**.

To expand all search results:

- On Windows / Linux, press `Ctrl+Shift+{` or `}`
- On macOS, press `Command+Option+{` or `}`

To clear your search results, click **Clear**.

Search for text in a specific tool

To narrow your search scope to a resource opened in a specific tool, you can use a built-in search bar if the tool supports it.

Search bars have up and down buttons to jump to previous and next search results.

To open a built-in search bar in a specific tool, press `Command+F` (Mac) or `Control+F` (Windows/Linux).

Not all DevTools panels and tabs have a built-in search bar but those that do, often provide tool-specific features. Below is a list of tools with search bars and their features.

Panel or tab	Case-sensitive	RegEx	Scope	Tool-specific features
Elements			DOM tree	Search by selector and XPath
Console	✓	✓	Log messages	
Sources	✓	✓	Current source file	Replace
Network	✓	✓	Network headers and responses	
Performance	✓	✓	Activities	
Memory	✓		Profiles	Search sampling profiles by cost, name, and file
JavaScript Profiler	✓		CPU profiles	Search by cost, name, and file
Quick Source	✓	✓	Current source file	Replace
