The most awesome validation engine ever created for PHP. (<http://bit.ly/1a1oeQv>)

- Complex rules made simple: `v::numericVal()->positive()->between(1, 255)->validate($input)` .
- Granularity control (<https://github.com/Respect/Validation/blob/HEAD/docs/README.md#validation-methods>) for advanced reporting.
- More than 100 (fully tested) validators.
- A concrete API (https://github.com/Respect/Validation/blob/HEAD/docs/CONCRETE_API.md) for non fluent usage.
- Works on PHP 5.6+
